## Wave on a Rotating String

A string of length $L$ and mass per unit length $\lambda$ is tied down at one end to a rod rotating at angular speed $\Omega$, and the other end is left free. Assume that the rotation is fast enough so that gravity is negligible.

(a) This string can oscillate in both the $y$ direction, and the $z$ direction. Show that $y$ and $z$ obey two different wave equations, and find the equation for each.
(b) Find the normal modes and their associated frequencies. ${ }^{1}$

[^0]
[^0]:    ${ }^{1}$ The answer should involve Legendre polynomials.
